

PUBLIC RESEARCH NOTE

Novo Nordisk: *franchise, or falling knife?* — what is the de-rated price assuming — and is Lilly simply ahead?

For long-term, index-leaning investors weighing whether an active overweight in Novo makes sense. A full nine-step diligence on Europe's fallen champion: what the ~14× multiple actually prices in — and whether the de-rating is justified by the fundamentals. I'm showing my work — not giving a call. Data as of 6 July 2026.

- **The market prices Novo for near-zero growth.** A reverse-DCF (my calculation) implies only ~0–3% annual earnings growth for a decade — for a ~21%/yr historical compounder. Run 5,000 times (seeded model): modelled fair value clears today's price in ~52% of simulations if cash flow normalises — ~0% if it doesn't.
- **Quality is elite but turned down across the board in 2025.** Gross margin 84.7%→81.0%, return on capital 88.5%→39.3%, and free cash flow went **negative** in 2024.
- **Lilly leads on momentum.** (Eli Lilly — the US pharma giant and Novo's main rival.) ~\$65bn revenue (+45%) vs Novo ~\$47bn; its Zepbound +175% vs Novo's Wegovy +31%; Lilly's drug won the only head-to-head.
- **The key risk:** if the decline is structural (not cyclical), the low multiple reflects lower earnings power, not opportunity — and in the one named pharma precedent (PD-1), the head-to-head loser did not regain the lead.
- **The swing question:** does growth re-accelerate off 2026's trough? Genuinely uncertain — where the whole case is won or lost.

Key players & terms

New to this sector? Skim these once and the rest reads easily. At heart this is a story of **two companies racing each other** in obesity and diabetes drugs: **Novo Nordisk** and **Eli Lilly**.

Eli Lilly ("Lilly")

The US pharmaceutical giant and Novo's main competitor in diabetes and obesity. The rivalry runs through this whole note.

Semaglutide

Novo's flagship molecule. Sold as **Ozempic** and **Rybelsus** (diabetes) and **Wegovy** (obesity).

CagriSema

Novo's next-generation obesity drug candidate — its main pipeline hope to answer Lilly.

REDEFINE 1 / 2 / 4

The clinical trials of CagriSema. 1 & 2 are the approval trials (both passed); 4 is the head-to-head vs tirzepatide (narrowly lost).

Medicare cut (IRA)

A US law forcing steep price cuts (~71%) on Novo's semaglutide for Medicare patients from 2027.

GLP-1

The class of drugs behind the boom — they mimic a gut hormone that curbs appetite and blood sugar.

Tirzepatide

Lilly's rival molecule. Sold as **Mounjaro** (diabetes) and **Zepbound** (obesity) — it beat Novo's drug head-to-head.

Orforglipron

Lilly's experimental obesity drug in *pill* form — cheaper and easier to scale than injections.

Reverse-DCF

A valuation check that backs out the growth rate the current share price already assumes.

CER

"Constant exchange rates" — growth with currency swings stripped out, so the underlying trend is clearer.

Company snapshot — read this first

A one-page profile of the company: what it is, how it makes money, how big it is, and the tension this note explores. **This section matches the standalone company snapshot; the rest of the note expands the analysis.** Prices are market quotes; market cap, EV and multiples are my own calculation. All figures from Novo's public filings, as of 6 July 2026.

€193–197bn Market cap	~14× / ~10.3× P/E · EV/EBITDA	DKK 309bn FY25 sales	59.6% Obesity vol. share
--------------------------	----------------------------------	-------------------------	-----------------------------

What it is, in plain English. Novo Nordisk is a *Danish pharmaceutical company* and a global leader in diabetes and obesity care. Most revenue comes from one family of GLP-1 drugs based on **semaglutide** — Ozempic and Rybelsus (diabetes), Wegovy (obesity) — plus legacy insulin and a small rare-disease arm. It is **vertically integrated and foundation-controlled** (ordinary shareholders cannot force a sale), earning high margins on patent-protected GLP-1 drugs, mostly in the **US (56% of revenue)**.

THE TENSION THE FULL DILIGENCE TACKLES

"Branded-obesity volume leader (59.6%) in a market that grew ~104% in 2025 — yet it lost the only head-to-head to Lilly (25.5% vs 23.0%) and, for the first time, every quality metric turned down together."

The question: a cyclical dent, or a structural decline?

Key products: Ozempic (≈ biggest single product), Rybelsus, Wegovy (injection + a new oral pill, US launch January 2026), legacy insulins, and a pipeline broader than one molecule (CagriSema — filed, but missed the head-to-head; amycretin — a strong next-generation candidate; plus MASH, cardiovascular and rare-disease assets). **What to watch:** US Wegovy weekly Rx share vs Zepbound · capex declining + free cash flow recovering · 2026 vs guidance (−4 to −12% CER) · whether the 2027 Medicare cut spreads to commercial channels. **Key risks:** single-molecule concentration · structural share loss to Lilly · US net-price reset (IRA/340B) · capex stays elevated · foundation control (a patient, through-cycle owner — but limited minority leverage).

1 The business

As the profile above notes, Novo is still *roughly two-thirds diabetes by revenue*, with obesity the growth engine and semaglutide (Ozempic, Rybelsus, Wegovy) the central molecule. Two further points matter here: Diabetes + Obesity together are ~94% of sales, and the US is 56% of revenue – so US pricing is the dominant external variable. And it is foundation-controlled: the Novo Nordisk Foundation holds ~77% of the votes on ~28% of the economics – a patient, through-cycle owner (it can fund the capacity build-out that public-market pressure would punish), though one that limits minority-holder leverage and takeover optionality. Danish foundation ownership has underwritten some of Europe's most durable compounders; the flip side is that shareholder value is one objective among several.

SEGMENT / GEOGRAPHY – FY2025 (DKK M)	SALES	% TOTAL
Diabetes care	207,109	67%
Obesity care	82,347	27%
Rare disease	19,608	6%
US Operations / International	173,166 / 135,898	56% / 44%

Pipeline – CagriSema, and breadth beyond it

CagriSema – Novo's next-generation obesity drug and its main pipeline hope to answer Lilly – cleared the two trials needed for approval (called **REDEFINE 1 and 2**: 22.7% and 15.7% weight loss vs placebo). What it *lost* was the head-to-head trial (**REDEFINE 4**) against Lilly's rival drug **tirzepatide**, narrowly, on weight loss (23.0% vs 25.5%) – hence "wounded, not dead." (REDEFINE is simply the name of CagriSema's trial programme; the numbers are individual studies within it.) And the pipeline is broader than CagriSema – most notably **amycretin**, a next-generation molecule (in both pill and injection form) whose strong early trial data many read as Novo's real long-term answer to Lilly, alongside candidates in liver disease (MASH), cardiovascular disease and sickle-cell disease – which *partly offsets* Novo's dependence on one molecule.

2 The industry & the duopoly

Branded GLP-1 obesity is a *secular, ~100%-growing market* (up ~104% in 2025) dominated by Novo and Eli Lilly. Novo holds the volume lead (59.6% branded share), but on momentum Lilly is ahead.

Exhibit 1: Lilly is bigger and growing ~5× faster – momentum has shifted

Source: Novo AR 2025 (~\$47bn from DKK 309.1bn, FX-converted); Eli Lilly FY2025 results (SEC / IR, \$65.2bn). Retrieved 6 July 2026.

SCOREBOARD FY2025	NOVO	LILLY
Revenue growth	+10%	+45%
Obesity brand growth	+31%	+175%
Head-to-head weight loss	23.0%	25.5%
2026 revenue guidance	-4 to -12%	~+25%

Source: Novo AR 2025 & Q1 2026 6-K; Eli Lilly FY2025 results.

The oral battle is the decisive axis: Novo's Wegovy pill is a peptide (higher efficacy, harder to scale); Lilly's orforglipron is a small molecule (lower efficacy ~12.4%, but far cheaper to scale) – which could commoditise the tier Novo's pill depends on. **Pricing:** the semaglutide franchise faces a ~71% Medicare price cut from January 2027 (Medicare channel only). The market is secular; Novo's problem is competitive + pricing, not demand – the market grew ~104% while Novo grew ~10%, and that gap is share loss.

"A secular winner's market in which Novo is currently the #2-by-momentum."

– the cycle / industry lens

3 The financials

DKK M / %	2021	2023	2024	2025
Net sales	140,800	232,261	290,403	309,064
Gross margin	83.2%	84.6%	84.7%	81.0%
ROIC	69.0%	88.5%	63.9%	39.3%
Free cash flow	29,319	68,326	(14,707)	28,295
Share repurchases	19,447	29,924	20,181	1,388

Source: Novo AR 2025 "Five-year overview" + FY 6-Ks. Retrieved 6 July 2026.

Exhibit 2: Free cash flow went negative in 2024 – the valuation needs it to recover

Source: Novo AR 2025 "Five-year overview" (free cash flow, DKK bn; 2024 = -14.7).

The signature is elite by pharma standards but *turned down across the board in 2025*: margin, return on capital and cash conversion all fell as a huge capacity build-out and the Catalent acquisition consumed cash, and buybacks were cut 93% (the dividend was held). The key question is whether that is a cyclical build-out or a structural reset.

4 What's priced in

Exhibit 3: The share is down ~54% from its 2023 peak — the drawdown behind the near-zero-growth price

Source: Novo AR 2025 "Five-year overview" (NOVO-B year-end closing price, DKK) + market quote for July 2026. -54% from the 2023 peak. Retrieved 6 July 2026.

On normalised earnings (assuming capex falls back toward depreciation), today's price implies just *~0–3% annual growth for a decade* at an 8–10% cost of equity — pessimistic for a 21.7% historical compounder. But it's conditional: anchor on today's depressed free cash flow and the same price implies +6–20%, i.e. the price already requires a big recovery. So the low implied expectation is an opportunity only if the capex build-out normalises.

IMPLIED ANNUAL GROWTH PRICED IN	8% COE	10% COE
On normalised earnings (capex normalises)	-1% to +1%	+3%
On today's actual free cash flow	+6% to +15%	+8% to +20%

Reverse-DCF (my calculation, two-stage, 2.5% terminal). Trailing P/E ~14×, EV/EBITDA ~10.3×. [Inferred]

Mapping scenarios to that: the market's implied path sits **between a bear case (flat-to-declining) and a base case (~5–8% growth), closer to bear**. So the setup only needs the base case to be roughly right to offer upside — but it has no cushion if the bear case is right.

"The price already embeds the bear case — the question, for you to judge, is whether the bear case is right."

— the valuation lens

What the price is assuming – the valuation, run properly

The most useful way to read DKK 324 is backwards. A reverse-DCF asks: what growth does today's price already *require*? The answer: roughly *1% profit growth a year, for a decade* – a near-zero-growth assumption for a company that grew north of 20% a year through the GLP-1 boom.

Exhibit 4: What the price is paying for – today's market cap (dashed) sits just above the zero-growth path

Source: Novo filings + market quotes; my calculation (scenario model, 9% discount, 2.5% terminal). Chart data ships as a CSV twin with this note. [Inferred]

Is ~1% a reasonable expectation? Against eleven actual pharma peers — Lilly, Roche, Novartis, AstraZeneca, Sanofi, GSK, Merck, Pfizer, AbbVie, Amgen, Bristol Myers — two things stand out. The group's median revenue growth was *~4% a year*, and only a quarter sustained more than 10%. But Novo's own record was the *second fastest of the twelve* — while the ~1% now baked into its price would rank *tenth*.

The outside view: what companies like this actually did

Exhibit 5: The peer evidence — Novo's record sits second from the top; the growth its price implies sits near the bottom

Source: peer company filings via public market data (~4-year windows); my calculation. Survivorship caveat: failed companies left the sample, so true base rates are lower than shown. [Inferred]

In the space of roughly a year, the market has repriced the industry's number-two grower as a near-bottom decliner. That repricing is either justified — the head-to-head result plus the 2027 Medicare cut really do make Novo a near-bottom grower — or current expectations understate a proven compounder in a difficult stretch. Stories can argue either side; the honest move is to stop arguing and run the distribution.

Five thousand futures, one hinge

So I ran the valuation five thousand times, drawing growth around the *pharma-peer* median – with a real bear floor and a share of outright structural-break scenarios – rather than around hope. The result splits on a single assumption, and it is not the share price.

Exhibit 6: The whole argument in one picture – the gap between the two humps is the capex assumption

Source: my calculation – seeded Monte Carlo, 5,000 draws per case, both cases on the same seed; earnings bases spot-checked to AR 2025 (cash-flow-statement FCF DKK 28,989m, p.84; the AR five-year overview shows DKK 28,295m on its own definition – both filed, definitional difference). [Inferred]

CASE	MEDIAN FAIR VALUE	P(FAIR VALUE > DKK 324)
A – cash flow normalises toward profit (as guided)	≈ DKK 332	≈ 52%
B – cash flow stays as-is	≈ DKK 101	≈ 0%

Neither case is ever quoted without the other – the gap IS the finding. [Inferred]

If Novo's currently depressed free cash flow normalises back toward its profit once the build-out ends, modelled fair value clears today's price in about half of the simulations: *roughly even odds, under Case A's assumptions* – not a discount. **If cash flow stays where it is, it clears in none of them.** The share price is not really the question. The capex hinge is.

5 The four questions that decide it

QUESTION	WHERE THE EVIDENCE POINTS
Moat = molecule (losing) or franchise (durable)?	Franchise > molecule, but eroding at the margin – defending, not extending.
Capex/ROIC – cyclical or structural?	Partial normalisation likely; returns settle below the old peak.
Can oral + pipeline + International offset Lilly + the price cut?	The swing question – genuinely uncertain.
How deep/permanent is the US price reset?	Structural downtrend, gradual not a cliff (Medicare channel).

Through different investing lenses (perspectives, not a scorecard)

Quality: elite signature, but every metric turned down in 2025; the moat is real yet narrowing. **Cycle:** sentiment swung euphoria→despair – a contrarian setup, if the analysis holds. **Valuation:** undemanding, but conditional on the cash-flow recovery. **Inversion / risk:** the sharpest risk is becoming "the leader who loses the head-to-head and doesn't recover"; mitigants are incumbent share, breadth beyond one molecule, and the dividend. *(Perspectives to weigh – not ratings, not a recommendation.)*

6 Base rates & the key risk

The two sides of the debate, in one box (thesis / antithesis):

LENS	BULL	BEAR
Franchise	GLP-1 secular; breadth beyond semaglutide; a strong #2 can still compound	#2 in a duopoly rarely regains leadership; semaglutide dependence
Economics	Returns still high; margins elite; capex normalises → cash flow recovers	Structural capex arms race; returns permanently lower; cash flow never fully recovers
Pricing	The price cut is a manageable drag (Medicare channel)	It spreads to commercial; net price falls faster than volume

And the base rates – reasoning by reference class (illustrative, not a full dataset):

WHEN THIS HAS HAPPENED BEFORE...	...HOW IT USUALLY GOES
A pharma #2 loses the pivotal head-to-head (e.g. Opdivo vs Keytruda in lung cancer)	In the named precedent, the loser did not regain the lead (single analogue, not a base rate)
A very-high-ROIC company's returns over time	Fade, but often stabilise above cost of capital
A negotiated (IRA-style) price cut	Gradual drag, not an overnight cliff
Buying quality after a ~50% fall on fear	Bimodal – strong recoveries and permanent impairments both occur

THE KEY RISK (HONESTLY STATED)

Novo becomes "the Opdivo of obesity": the molecular arms race, once lost, compounds – Lilly's lead plus its lower-cost oral take share, the capex arms race proves permanent so free cash flow never recovers, and the 2027 price cut deepens. On today's cash flow the price already needs a recovery, so if the decline is structural the ~14× multiple reflects reduced earnings power rather than opportunity.

What I'm watching (things to monitor, not instructions)

US Wegovy weekly prescription share vs Zepbound (the earliest tell) · whether 2026 lands near the bottom of guidance and 2027 growth inflects · whether capex declines and free cash flow recovers · whether the Medicare price cut spreads to commercial channels.

7 You draw the conclusion

I keep my own buy/sell/hold decision private, deliberately: it depends on *my* circumstances and portfolio, which aren't yours, and a public "call" is both less useful and more fraught than showing you how to reason about it. So here are the questions I think it comes down to – and only your own honest answers to them can settle it for you.

1. **Do you understand this industry well enough** to judge pipeline and pricing risk – or is it honestly "too hard" for you?
2. **Cyclical or structural?** Was 2025–26 a temporary dent (capacity build-out, accounting/pricing noise) or a permanent worsening of the competitive position?
3. **Do you already own this inside a broad index fund?** If so, does an active overweight clearly earn its place versus simply staying indexed?
4. **What specifically would change your mind** – in either direction – and are you watching for it?

By theme: Q1 = competence · Q2 = structure-vs-cycle · Q3 = portfolio context · Q4 = process.

If your honest answer to Q1 (competence) or Q2 (cyclical-vs-structural) is "too hard" or "no", the default answer for most investors is: stay indexed and watch.

My honest summary of the setup: an elite franchise priced for a pessimistic path, at a washed-out sentiment low – *and* a faster-growing competitor that just won the head-to-head, with an unfriendly base rate for #2s that lose. Roughly even odds under the recovery case, with real downside if it fails – compensation for uncertainty, not a free discount. Whether that's worth owning is a judgement only you can make for your own situation.
